

Integrating and managing services for the European Open Science Cloud

Research Computational Infrastructures: Cloud Infrastructures

Alessandro Costantini

for

CODATA-RDA Research Data Science Summer School, 5-16 August 2019, Trieste, Italy

eosc-hub.eu

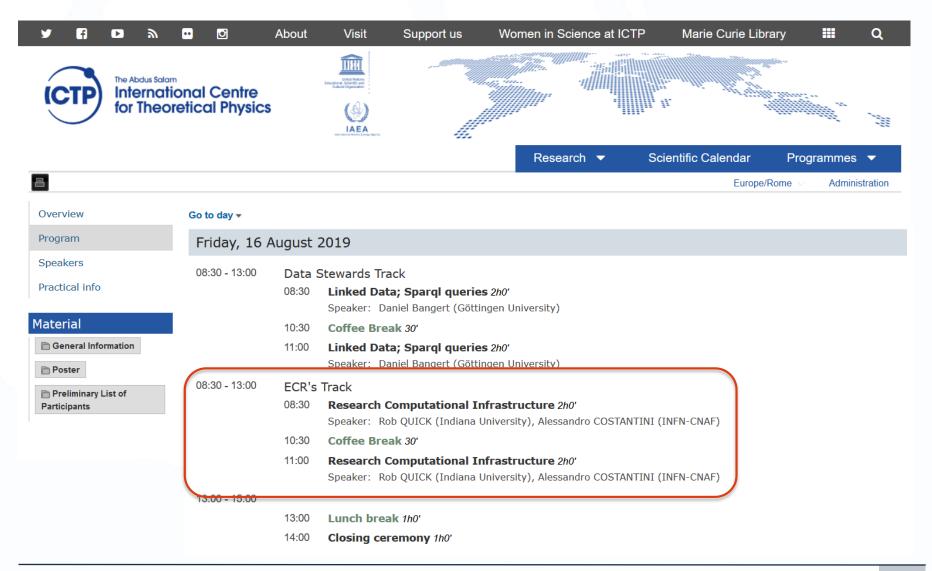

@EOSC_eu

http://indico.ictp.it/event/8706/

The trainer

- alessandro.costantini@cnaf.infn.it
- National Institute for Nuclear Physics (INFN)
- Cloud expert
- Involved in different cloud-oriented projects
- Based in Bologna, Italy
- Member of Distributed Systems Unit @ INFN-CNAF

https://www.cnaf.infn.it

Training goals

- 1. Learn the concept of Cloud computing
- 2. Hands-on with Cloud services
 - IaaS approach with OpenStack
 - SaaS approach with Jupyter Notebook service
- 3. See future possibilities with EOSC

Outline

PART 1 (8:30-10:30)

- Introduction to cloud computing (70')
- Introduction to EGI and related infrastructure (10')
- Identity and Access Management: 101 + Hands-on (20')
- Introduction to Hands-on: Explore Openstack IaaS (20')

BREAK (30')

PART 2 (11:00-12:45')

- Hands-on exercise 1 deploy a VM in the laaS environment (30')
- Introduction to Hands-on: exercise 2 (10')
- Hands-on exercise 2 Jupyter Notebooks (30)
- The future of compute infrastructures in Europe: EOSC (20')

Feedback forms (15')

Introduction to cloud computing

Cloud Computing

EOSC-hub Distributed computing

 "The Cloud" means essentially the use of distributed resources, which is certainly not a new thing

How grid computing helped CERN hunt the Higgs

FEATURE | AUGUST 15, 2012 | BY JOANNAH CABORN WENGLER

"As a layman, I'd say we have it." It was with these words that CERN's director general, Rolf Heuer, last month announced the discovery of a particle consistent with the Higgs boson, the long-sought-after corner stone of particle physics' standard model. The scientific results upon which Heuer based his statement - taken from two experiments involved, ATLAS and CMS - are now set to be published in the upcoming issue of Physics Mysics Mysic

"Particle physics is nowadays an international and highly data-intensive field of science and it requires a massive international computing effort," said Roger Jones, ATLAS physicist and collaboration board chair of the Worldwide LHC Computing Grid (WLCG), the organization

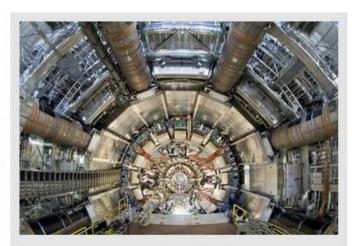

Image courtesy ATLAS experiment © CERN

EOSC-hub Grid Computing

- Provisioning and use of massively distributed and federated resources routinely happens since several years.
- An example of great success in the scientific world is given by Grid Computing.
- On the right:
 - Real-time situation of computation and data transfer for the physics experiments running at the CERN Large Hadron Collider (LHC).

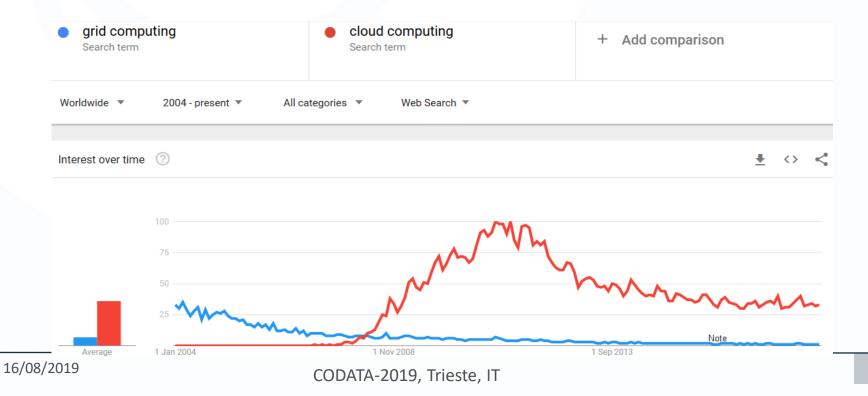

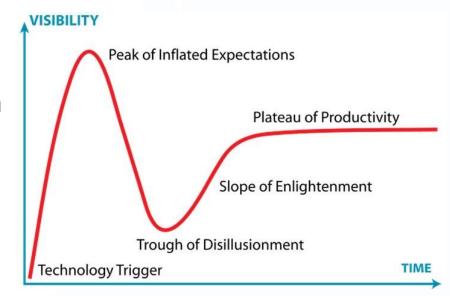

- Grid Computing, that is crucial for big scientific collaborations, never spread outside this field
- Google trends (http://www.google.com/trends/): Grid Computing vs. Cloud Computing

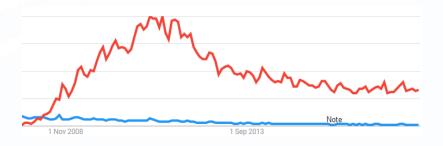

EOSC-hub Cloud hype cycle

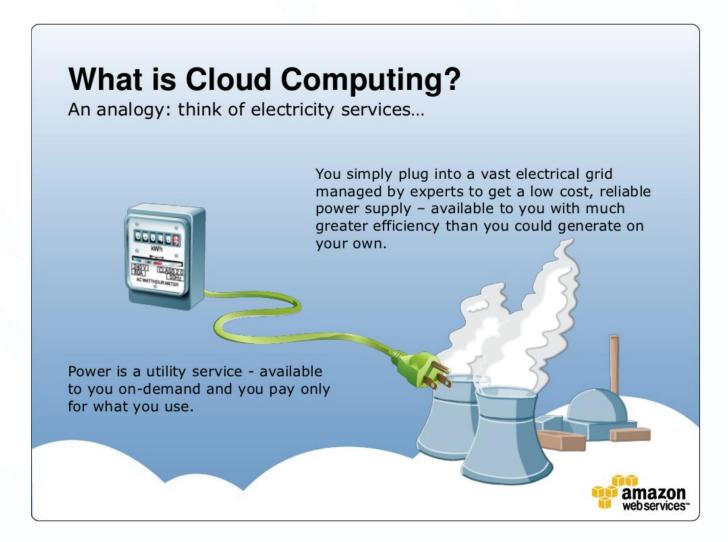

- The hype cycle is used to represent the maturity, adoption and social application of specific technologies, through five phases (bit.ly/2H4iXON):
 - Technology trigger
 - Peak of inflated expectations
 - Trough of disillusion
 - Slope of enlightenment
 - Plateau of productivity
- See also the "Gartner Hype Cycle for Cloud Computing" for more details (<u>bit.ly/33p1UjA</u>)

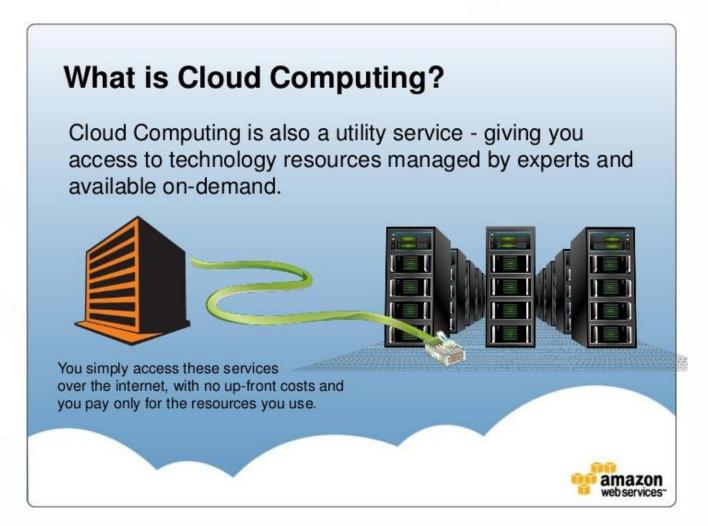

Cloud computing: Analogy

Source: bit.ly/2Z4kHNG

EOSC-hub Cloud computing: Concept

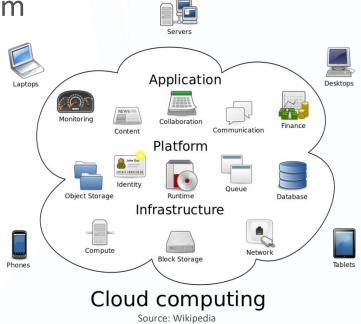

Source: bit.ly/2Z4kHNG

EOSC-hub Cloud Computing: Definition

 The canonical definition comes from the US National Institute of Standards and Technology (NIST) bit.ly/2YOop2X

• In a nutshell, Cloud Computing deals with:

Supplying

information and communication technologies

as a <u>service</u>

Self-service, on-demand

 A consumer can unilaterally provision computing capabilities as needed automatically without requiring human interaction with each service provider.

Network-based access

 Capabilities are available over the network and accessed through standard mechanisms that promote use by heterogeneous thin or thick client platforms

Resource pooling

 The customer has no control or knowledge over the details of the provided resources, that are managed by the Cloud provider

Elasticity

 Capabilities can be elastically provisioned and released to scale rapidly commensurate with demand. To the consumer, the capabilities available for provisioning often appear to be unlimited

Pay-per-use

The customer pay only for what he/she used.

EOSC-hub An analogy: car rental

Self-service, on-demand

Online or by telephone booking

Network

Network of car rental all over the world

 The car rental manages the availability of cars for customers

Elasticity

 The number of cars can vary depending on users demand

Pay-per-use

 The customer pays for the time he/she used the service (no matter about tires, insurance, etc.)

Economy

Compact

Intermediate

Full Size

Premium

Luxury

Minivan

Convertible

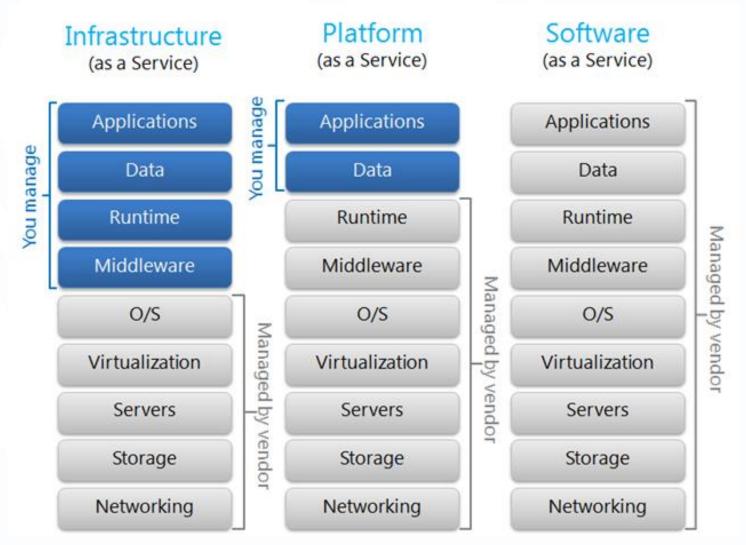

Premium SUV

EOSC-hub The emphasis on "Service"

- In the standard Cloud definition ("Supplying information and communication technologies as a service"), the service toward the Cloud users is the essential part e.g. for usability, flexibility, reliability, etc.
- Cloud computing is indeed typically modeled around service models primarily linked to:
 - —<u>Infrastructure</u> (**IaaS** → Infrastructure as a **Service**)
 - Platform (PaaS → Platform as a Service)
 - -Software (SaaS \rightarrow Software as a Service)

Source: bit.ly/2KuxiFW

EOSC-hub laaS - Infrastructure as a Service

- laaS, the basic building blocks of a data center:
 - —Storage → I want to store data, lots of data, at low cost
 - Compute → give me a machine where I can host my services or run my applications
 - Network → create a "Software-Defined Network" infrastructure for me
- In many cases, in a "virtual" form
- No need to know details, no need to contacts administrators to install something

EOSC-hub PaaS - Platform as a Service

- PaaS, a computing platform providing you with several building blocks or components that you can request programmatically or statically. For example:
 - A cluster of systems with operating system and an entire execution environment installed and configured.
 - A web server (or a cluster of web servers) with database(s), virtual storage, load balancers, other dependencies.

EOSC-hub SaaS - Software as a Service

- With SaaS, you are directly given access to some application software. You don't have to worry about the installation, setup and running of the application. You typically access SaaS applications via a web browser.
- For example: Gmail, social media such as Facebook, Twitter, Instagram, etc.

	laaS	PaaS	SaaS
What you get	You get the infrastructure. Freedom to use or install any OS or software	You get what you demand: software, hardware, OS, environment.	You don't have to worry about anything. A pre-installed, pre-configured package as per your requirement is given.
Deals with	Virtual Machines, Storage (Hard Disks), Servers, Network, Load Balancers etc	Runtimes (like java runtimes), Databases (like MySQL, Oracle), Web Servers	Applications like email (Gmail, Yahoo mail etc), Social Networking sites (Facebook etc)
Popularity	Highly skilled developers, researchers who require custom configuration as per their requirement or field of research.	Most popular among developers as they can directly focus on the development of their possibly complex apps or scripts.	Most popular among normal consumers or companies which rely on software such as email, file sharing, social networking as they don't have to worry about the technicalities.

EOSC-hub Remember what matters...

What matters, at the end, are the applications.

TRUE!

... however, without Cloud providers (public or private), and without efficient and effective ways of managing distributed resources, applications cannot be deployed!

(rather obvious isn't it)

How do you find, provision and use resources in the Cloud, then?

EOSC-hub Let's add dimensions

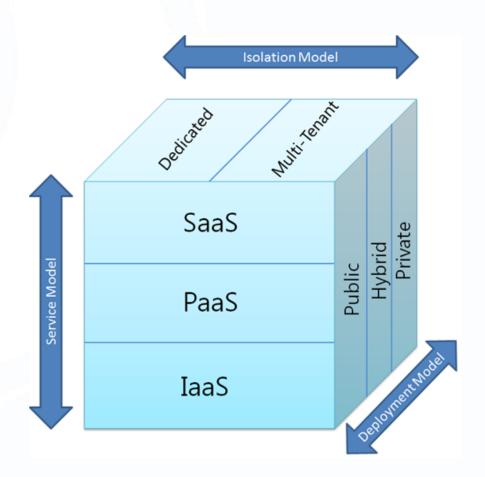

Beyond the service models
 (laaS, PaaS, SaaS),
 important parts to define
 and understand Cloud
 computing are the
 models linked to:

deployment

• where distribute services

isolation

• <u>how</u> isolate services

Source: bit.ly/2KuxiFW

EOSC-hub Deployment: "Cloud types"

Private Cloud:

 The infrastructure is procured for exclusive use by a single organization. Management, operation, ownership, location of the private cloud, however, can be independent by the organization using it.

Community Cloud:

— The infrastructure is available to a community of organizations sharing a common goal (for instance: mission, security requirements, adherence to common regulatory rules, etc.)

Public Cloud:

— The infrastructure is **available to the public** at large. Management can be either public or private. The location is at some service supplier premises.

Hybrid Cloud:

 The infrastructure is a combination of two or more Cloud infrastructures (private, public, community Cloud), connected so that there is some form of portability of e.g. data or applications.

- Cloud isolation models are important and often ignored. We could have:
 - <u>Dedicated</u> infrastructures
 - Multi-tenant infrastructures (i.e., with several [types of] customers)
- The isolation type is essential in many regards, such as:
 - Resource segmentation
 - Data protection
 - Application security
 - Auditing
 - Disaster recovery

- https://goo.gl/qxRtrw
- 7 principal cases:
 - End user \rightarrow Cloud
 - Enterprise \rightarrow Cloud \rightarrow end user
 - Enterprise → Cloud
 - Enterprise \rightarrow Cloud \rightarrow enterprise
 - Private Cloud
 - Changing Cloud vendors
 - Hybrid Cloud

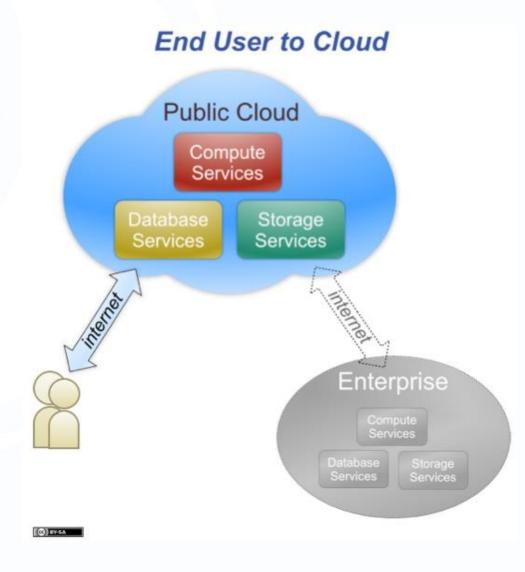

Source: bit.ly/305Jfre

EOSC-hub End user → Cloud

- The user accesses data or application into Cloud (e.g. email, social networks)
- Key points:
 - Identity
 - Authentication has to be provided
 - Open client
 - Access should not require particular technology
 - Security/privacy
 - -SLA are simpler than those with enterprise

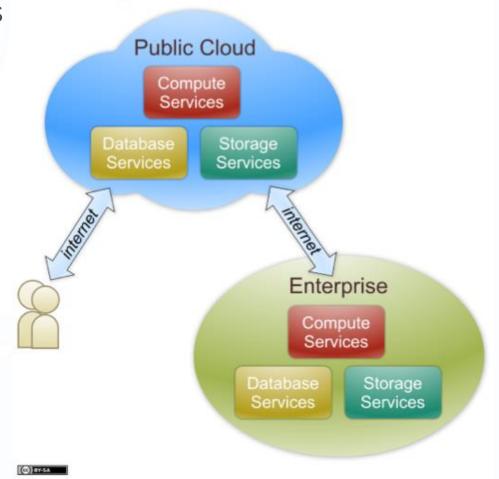

EOSC-hub Enterprise → Cloud → End user

- An enterprise uses the Cloud to provide services to its users
- Key points:
 - -Identity → federatation
 - an enterprise user is likely to have an identity within the enterprise
 - Location awareness (e.g. for legal issues)
 - Monitoring (for cost control)
 - Security
 - Common APIs (for different vendors)
 - -SLA

Enterprise to Cloud to End User

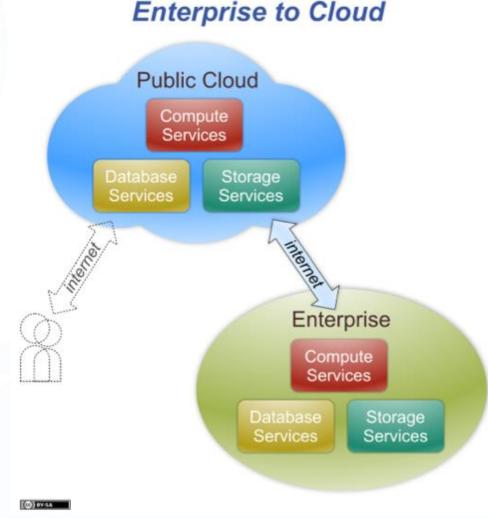

EOSC-hub Enterprise → Cloud

 An enterprise uses the Cloud for its internal processes

Key points:

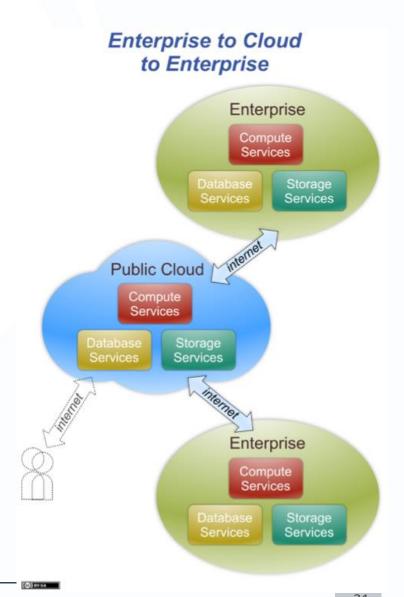

- Suppletive storage (e.g. for back-up)
- "Cloud bursting" to supply peak demand
- Cloud usage for some application (email, calendar, etc.)
- Use of standards, avoiding vendor lock-in

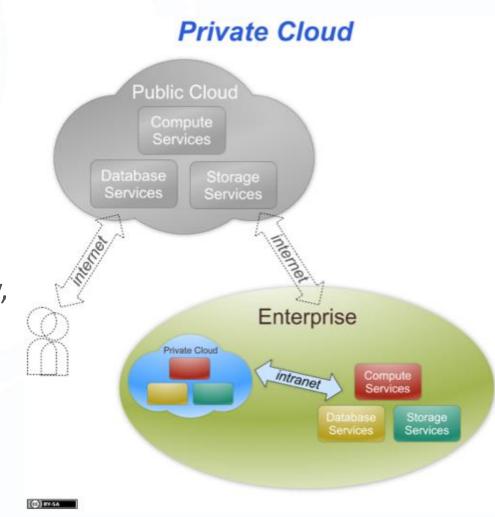

EOSC-hub Enterprise → Cloud → Enterprise

- Two enterprises that use the same Cloud
- Key points:
 - Concurrency
 - For applications and data shared between different enterprises. If two enterprises are using the same cloud-hosted application, VM, middleware or storage, it's important that any changes made by either enterprise are done reliably

- The cloud is contained within the enterprise
 - This is useful for large enterprises
- Does not require:
 - identity, federated identity, location awareness, concurrency, industry standards, common APIs for Cloud middleware

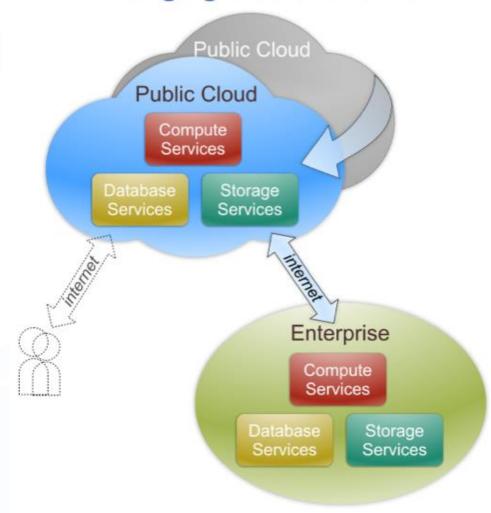

EOSC-hub Changing Cloud vendors

- An enterpraise that want to change a Cloud vendor or add another
- Key point:
 - Standardization

Changing Cloud Vendors

 Using Cloud public and private together

Key point:

- For the end user this use case should be not different by the case End user → Cloud
- The end user does not know the details of the underlying infrastructure

Hybrid Cloud Public Cloud Public Cloud Compute internet Services Compute Services Storage Services Services Enterprise Private Cloud intranet Services

EOSC-hub Cloud use cases: some examples

Web hosting

 Many organizations choose to host their web services in the Cloud because it can balance the load across multiple servers and scale up and down quickly and automatically with traffic.

Testing and development.

 As with traffic bursting, you may not have the capacity to host lots of servers and storage in your data center for testing and development purposes. Using the public Cloud allows you to spin up servers as you need them, and then shut them down when you're finished.

Big Data and data manipulation.

 Maintaining and implementing compute resources to handle huge datasets can be expensive and complicated. Using Cloud computing resources, you can use only the resources you need to analyze data when you need them. Some public cloud vendors offer specialized managed Big Data services.

Source: https://goo.gl/29PQFH

Static vs Virtual

EOSC-hub Static vs virtual resources

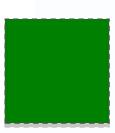

Source: http://slideplayer.com/slide/6085063/

EOSC-hub Virtualization and Cloud

Virtualization and Cloud computing

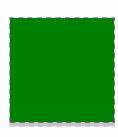

An analogy

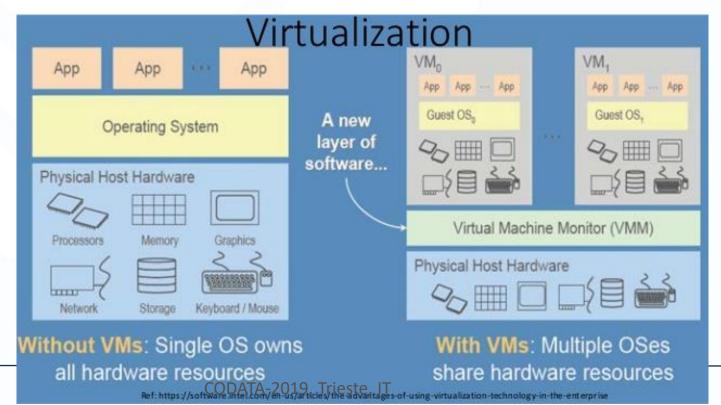

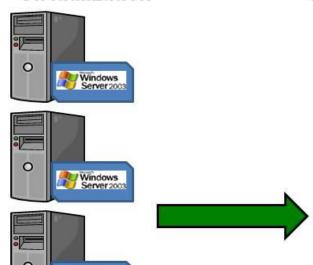

- Informally, by virtualization we mean the creation of a virtual version of something.
 - For instance, an hardware platform, an operating system, a storage device, a network resource.
 - Through an abstraction: an intermediate level between hardware/software and applications, simplifying and hiding underlying details.

EOSC-hub Let's go virtual

Workloads without Virtualization

 Servers poorly utilized at average of 4% to 7% capacity

Windows

Server 2003

- Limited in failover capability
- · Prone to hardware failure

Workloads migrated To Virtual Machines Using Virtualization

- · Each workload is now encapsulated stacking its workload for better hardware utilization - around 80%
- Inherit virtualization capabilities include:
 - Dynamic resource pools
 - · High availability without complicated clustering
 - · Provision new servers in minutes
- Virtual Machines are hardware independent

Source: https://technofirmsoftware.wordpress.com/tag/benefits-of-virtualization/

EOSC-hub Virtualization advantages (1/2)

Server consolidation

- Multiple VMs on the same host.
- Cost reduction for hardware provisioning that can simplify administrative and monitoring operations

Isolation (sandboxing)

- Application isolation.
- Code development, testing and debugging.
- Creating dedicated environment for legacy application.

On-demand VM provisioning

EOSC-hub Virtualization advantages (2/2)

- Decoupling of hardware and software
 - Suspend/Resume VMs.
 - Migration of VMs between physical hosts
- Testing of new versions of Operationg System, applications
 - Or of old versions: data preservation
- Emulation of hardware
 - different from that of the physical host
- Execution of applications
 - that can not run on the OS of the physical host

EOSC-hub Virtualization disadvantages

- Security.
 - On the same hardware different OS cohexist, managed by a software – higher probability of bugs or attack vectors:
 - VM-to-VM → network attacks
 - VM-to-HV (KVM o XEN)
 KVM is a Linux kernel module
 Xen is a hosted hypervisor, directly connected to the hardware →
 everything can be compromized
 - VM-to-QEMU
 QEMU is a complex software. In case of attack, the OS can be compromized.
- Performance
 - Overhead for the physical host
 - Worse performance for the VM, especially I/O

EOSC-hub Virtualization and/or Cloud **Computing?**

- Provisioning of VMs is not Cloud computing.
- Check the 5 Cloud characteristics:
 - Self-service, on-demand \rightarrow NO
 - tipically an IT department provides VMs
 - Network-based access → NO
 - deployment limited to "internal customers"
 - Resource pool → YES
 - Elasticity → NO
 - tipically an IT department installs OS + software and maybe not in a scalable mode
 - Pay per use \rightarrow NO
 - traditional billing

Migration to Cloud

EOSC-hub Application migration to Cloud

- Migration of an application from an existing data center to a Cloud infrastructure
- Which technical and business factors move to migration?
 - Cost reduction → resource pooling, pay-per-use
 - "Business agility" → deployment simplification
 - Management saving → performance (e.g. auto-scaling), delegation of operations
- Public or private Cloud?
 - WAN traffic? (tipically expensive)
 - Security?
 - Integration with other *legacy* applications?

EOSC-hub Stateless vs Stateful service

A stateless service

- provides a response without storing any state.
- − E.g.: simple Web server

A stateful service

- provides response on the basis of the state of the previous requests
- E.g.: Web server with a shopping cart

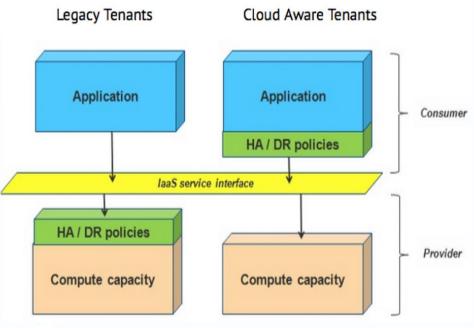

EOSC-hub Cloud-friendly applications

"Cloud-aware" applications:

- Distributed
- Stateless
- Fail-over in the app
- Scaling in the app

"Legacy" applications:

- Stateful
- Monolitic, no orizontal scalability
- Fail-over in the infrastructure
- Scaling in the infrastructure

Fonte: VMware

Cloud advantages

- A large cloud inrfrastructure permits to reduce costs for a single server.
 - More customers, less management costs for each customer.
- The resource aggregation allows their more efficient utilization.
- Flexibility and Scalability, Self-service provisioning and possibility to increase the resources through Cloud providers, instead of buying new resources
- Collaboration and Business opportunities, in terms of ubiquitous access to resources from any device (SaaS) and simple sale of software developed by someone else

Cloud-related risks

EOSC-hub Some Cloud-related risks

- Liability
- Security and privacy
- Lock-in
- Insecure or incomplete data deletion

 Some examples taken from a very popular public Cloud follow...

EOSC-hub Amazon Web Services

Amazon does not only sell books or general goods...

- Amazon Web Services:
 - on-demand cloud computing platforms to individuals, companies and governments, on a paid subscription basis.
 - Revenue: \$17.5 billion (FY17)
 - -Launched in March 2006

2017 Cloud Revenue	
Microsoft	\$18.6B
Amazon	\$17.5B
IBM	\$17.0B
Salesforce.com	\$9.92B (12 mos.ending Oct. 31)
Oracle	\$5.6B (12 mos.ending Nov. 30)
SAP	\$4.71B
Google	\$3B (est.)

DODECTALISTI

Source: bit.ly/2KHrwj5

EOSC-hub Unavailability

- Limitations of liability in case of unavailability of data or services.
 - Due e.g. to power outages, system failures, or to any other service interruption.
 - Or due to unauthorized access, alteration, loss or failure to store any content in AWS.

But you are responsible

You are responsible to make sure your data, code, etc.
is safe, protected from unauthorized access, and you
are responsible for your own backup (again – with if
it's in the order of several PB?)

4.2 Other Security and Backup. You are responsible for properly configuring and using the Service Offerings and taking your own steps to maintain appropriate security, protection and backup of Your Content, which may include the use of encryption technology to protect Your Content from unauthorized access and routine archiving Your Content. AWS log-in credentials and private keys generated by the Services are for your internal use only and you may not sell, transfer or sublicense them to any other entity or person, except that you may disclose your private key to your agents and subcontractors performing work on your behalf.

EOSC-hub Data property / privacy?

- When a contract with a Cloud provider gets cancelled, how can we make sure that all our data is removed?
- And how can I avoid vendor lock-in?
- But where is my data?
 How about tapping?

Microsoft admits Patriot Act can access EUbased cloud data

Microsoft's U.K. head admitted today that no cloud data is safe from the Patriot Act, and the company can be forced to hand EU-stored data over to U.S. authorities.

By Zack Whittaker for iGeneration | June 28, 2011 -- 08:10 GMT (09:10 BST) | Topic: Government : US

NSA infiltrates links to Yahoo, Google data centers worldwide, Snowden documents say

The CLOUD Act

- Clarifying Lawful Overseas Use of Data (CLOUD) Act was signed into law on March 23, 2018
- U.S. law enforcement officials at any level, from local police to federal agents, can force tech companies to turn over user data regardless of where the company stores the data
- Ability to enter into "executive agreements" with foreign nations, which could allow each nation to get its hands on user data stored in the other country, no matter the hosting nation's privacy laws. These agreements don't require congressional approval

Source: https://blog.ur-

browser.com/en/tag/europe-en/

See also "10 Things You Need to Know About the EU General Data Protection Regulation", https://www.wordstream.com/blog/ws/2 017/09/28/eu-qdpr

Differences in Privacy

- Privacy laws change with each administration.
- 2 Individuals have little ownership of their online data, which allows large businesses can monetize consumer behavior and habits
- Privacy laws are often a messy combination of public regulation, private self-regulation, and legislation which varies by state.
- Enforcement of privacy laws is carried out by several different government organizations, e.g. Federal Communications Commission (FCC) and Health Insurance Portability and Accountability Act (HIPAA).
- Numerous privacy organizations exist to provide legal framework, which ensure digital privacy to Americans. Ex: American Civil Liberties Union (ACLU) and the Electronic Frontier Foundation (EFF).
- 6 Companies can keep data indefinitely, depending on their own Terms of Service.

- Privacy laws have less turnover when administrations change because most EU member states aren't as polarized as the US.
- 2 EU laws respect "private and family life" and allow citizens to delete their data.
- Privacy laws are generally more comprehensive and geared towards consumers.
- 4 Enforcement of privacy laws is carried out by one authority, equally for all 28 member states.
- Due to the nature of EU rights, fewer privacy organizations exist but there are: The European Digital Rights (EDRi) and The European Privacy Association (EPA.)
- 6 EU citizens have the "right to be forgotten," meaning that search results can be removed if they are irrelevant or inadequate.

EOSC-hub More on privacy in the EU

- For personal data: GDPR (General Data Protection Regulation) – see https://www.eugdpr.org/
 - "The EU General Data Protection Regulation (GDPR) is the most important change in data privacy regulation in 20 years"
 - GDPR enforcement: 25 May 2018
 - The aim of the GDPR is to protect all EU citizens from privacy and data breaches in an increasingly data-driven world
 - Organizations in breach of GDPR can be fined up to 4% of annual global turnover or €20 Million (whichever is greater)
- What is personal data?
 - Any information related to a natural person or 'Data Subject', that can be used to directly or indirectly identify the person. It can be anything from a name, a photo, an email address, bank details, posts on social networking websites, medical information, or a computer IP address

But for non-personal data?

- E.g. scientific data (non related to "Data Subjects")
 - —See the draft "Regulation of the European Parliament and of the Council on a framework for the free flow of non-personal data in the European Union", http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:52017PC0495&from=EN

• Key points:

- Free movement of data within the Union (no strict data localization)
- Data availability for competent authorities (across the Union)
- Porting of data (no lock-in)

Miscellanea

Last but not least, the big misunderstanding

- Capacity is not infinite (although this is one of the postulates of Cloud computing). Nor are credit card limits.
 - Hence, resources might not be available when we need them; or, if available, they might not have the characteristics we need.
 - Unless maybe we are willing to pay some hefty over-provisioning costs.

EOSC-hub Cost evaluation

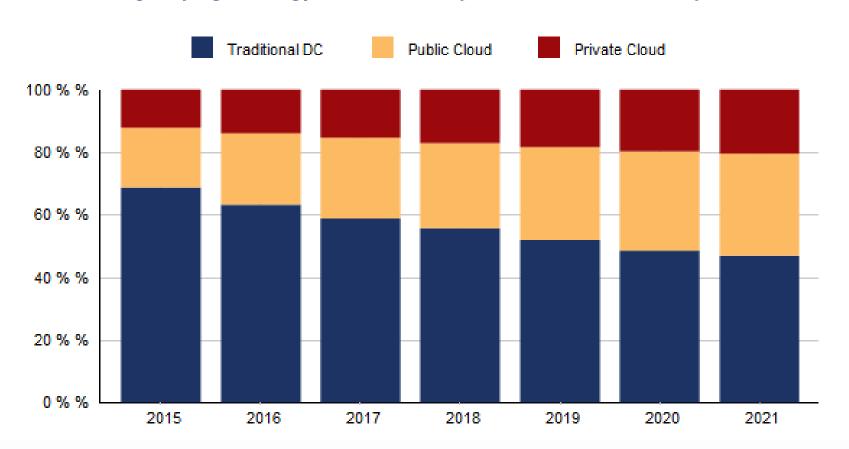

- Understand if by an economical point of view the best solution is a public or private Cloud is not easy. It requires ad-hoc investigation. E.g.:
 - How important is a possible data lost? And information leakage towards my competitors? And what about the know-how lost?
 - The terms of agreement with the Cloud provider are completely clarified?

EOSC-hub Cloud market Forecast

Worldwide Cloud IT Infrastructure Market Forecast by Deployment Type 2015 - 2021 (shares based on Value)

Source: bit.ly/2yZMrsp

EOSC-hub CNAF extension on public Cloud

 The increasing demand of computing resources led to the investigation of several techniques to dynamically extend the existing farm

 An approach to extend the INFN farm to the MS Azure Cloud INTERNET Web UI Squid 10.8.1.0/24 WN Istituto Nazionale di Fisica Nucleare LSF Master Computing Elements CLI

CODATA-2019, Trieste, IT

- Cloud computing is a distributed technology more flexible and usable than Grid computing
- Mature technology, adopted not only in the scientific field
- It extends the virtualization concept
- As many complex technologies, it can have pros and cons
 - You should be careful in order to understand whether Cloud can help you
- The Cloud market is strongly growing

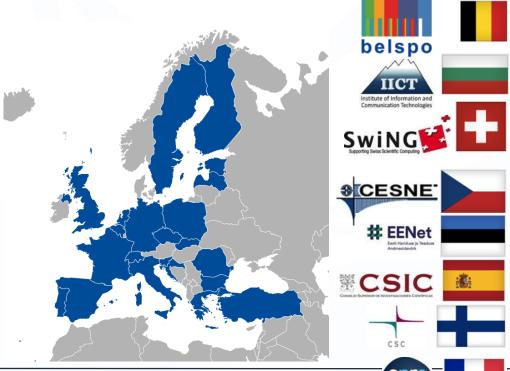

There is no Cloud, it's just someone else's computer

Infrastructure for research @Europe

EGI: Federation of national e-infrastructures

- Established in 2010
 - EGI Foundation: Coordinator (Amsterdam, Science Park)
 - NGIs: National e-infrastructures (22 country + CERN)
- Membership fees sustain the federation; Projects innovate (e.g. EOSC-hub)
- EGI = Compute, Storage, Data, Training, Consultancy services

Institutional

representatives

Grid

EGI Cloud Compute IaaS

- Run Virtual Machines on demand
 - Similar to AWS EC2/EBS or GCP Compute Engine
- Access is based on 'Virtual Organisations'
 - VO = group of users + cloud providers supporting them
 - Community-specific VOs e.g. CHIPSTER, EISCAT, etc.
 - Generic VOs e.g. fedcloud.egi.eu, training.egi.eu
- Diverse providers with common:
 - AuthN and AuthZ
 - VM Image catalogue (applications)
 - Information discovery
 - Accounting
 - Monitoring
 - GUI dashboard

Summary – Comparing compute infrastructures

Commercial clouds (e.g. Azure, AWS, GCE)	Academic clouds (e.g. EGI federated cloud, INFN, others)
 For interactive and batch computing For service hosting Flexible OS and application use Typically one provider is used Pay-as-you-go User support as paid service 	 For interactive and batch computing For service hosting Flexible OS and application use Single or multiple providers Free at the point of use (for research) With local user support

Federated access: Identity and Access Management

EOSC-hub Authentication and Authorization

 Typically, each of your applications and each of the resources that you want to access have some form of «Identity Management System»

EOSC-hub Local username and password

- The simplest form of authentication to a resource is to have local usernames and passwords.
- Local -> every system or application should store its own set of credentials.
 - -This way, if you connect for example to 10 different machines (or to 10 web applications), those 10 machines or applications should all have a local file storing your credentials (username and password), as well as those of everybody else allowed to connect to them.
 - In Linux systems, this file is typically /etc/passwd.
- Clearly, this is **not** a **scalable** method. So, we need something more sophisticated.

EOSC-hub Some IDP solutions

- Lightweight Directory Access Protocol (LDAP) to access (browse) the X.500 Directory via TCP/IP.
 - https://ldap.com
- Remote Authentication Dial-In User Service (RADIUS) is an intermediate service that can be used to connect to various services related to authentication and authorization.
 - https://tools.ietf.org/html/rfc2865
- Kerberos: a service based on shared keys offering strong authentication, often combined with LDAP to offer single sign-on for users.
 - https://web.mit.edu/kerberos/
- X.509 certificates: a solution used to overcome the issues of shared keys, widely used e.g. to securely identify web servers or Grid users.
 - https://en.wikipedia.org/wiki/X.509
- Security Assertion Markup Language (SAML): a standard used to implement single sign-on for Web applications.
 - http://bit.ly/2sggEAk

- All the mechanisms and protocols we have seen so far about Authentication and Authorization are useful and fine.
- However, we still have not solved the problem of how to generally authenticate and authorize services in a Cloud.
- This is where two newer protocols come into play: **OAuth** and **OpenID-Connect**.

EOSC-hub Oauth and OpenID-Connect

- OAuth is an authorization framework.
 - It deals with Authorization.
 - OAuth was designed to handle the Authorization of generic applications or resources (such as accounts, files, etc.) on the Internet.
 - https://oauth.net
- OpenID-Connect (OIDC) protocol
 - Is a simple identity layer on top of the OAuth framework, handle
 Authentication
 - Gives information about who the user is and how it was authenticated via an additional ID token (JSON Web Token, or JWT)
 - http://openid.net/connect/

A Cloud-friendly AAI solution: INDIGO IAM

https://www.indigo-datacloud.eu

- The INDIGO Identity and Access Management (INDIGO-IAM) service provides a layer where identities, enrolment, group membership, attributes and policies to access distributed res ources and services can be managed in a homogeneous and interoperable way, supporting the federated authentication mechanisms (SAML, OpenID Connect and X.509) behind the INDIGO AAI.
- The IAM service provides user identity and policy information to services so that consistent authorization decisions can be enforced across distributed services.
 - https://indigo-iam.github.io/docs/v/v1.4.0/

A Cloud-friendly AAI solution: INDIGO IAM

Flexible authentication support

 (SAML, X.509, OpenID Connect, username/password, ...)

Account linking

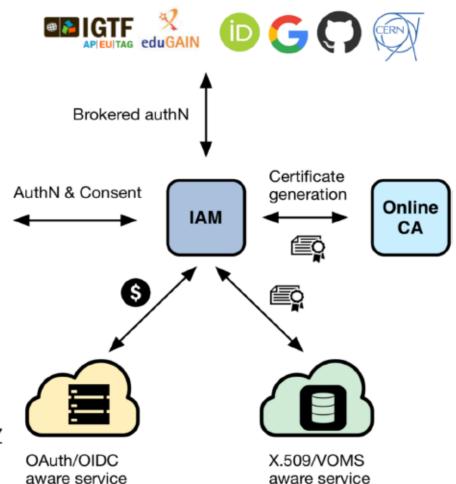

Registration service for moderated and automatic user enrollment

Enforcement of AUP acceptance

Easy integration in off-the-shelf components thanks to **OpenID Connect/OAuth**

Hands on Dealing with IaaS: The OpenStack implementation

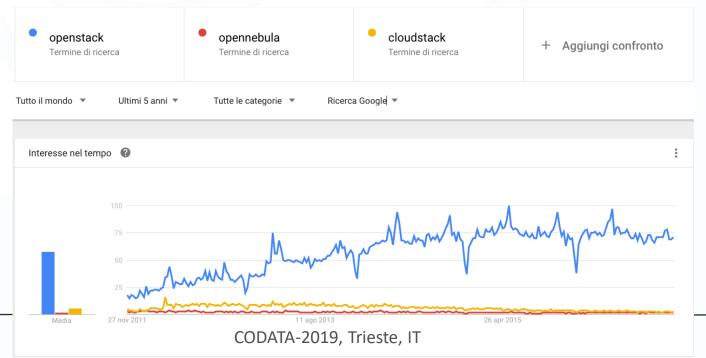

EOSC-hub What is OpenStack

OpenStack is a **free** and **open-source** software platform for cloud computing, mostly deployed as a **Infrastructure-as-a-Service** (laaS)

 interrelated components that control diverse, multi-vendor hardware pools of processing, storage, and networking resources throughout a data center.

EOSC-hub OpenStack principles 1/3

OpenStack is

- Open source
 - Fully Functional Open Source
 - Pluggable functionalities
 - Acceptable Licensing Apache License, 2.0
 - Dependencies and Optional Modules need to be vetted in the global requirements

EOSC-hub OpenStack principles 1/3

OpenStack is

- Openly designed
 - Common development cycle (most) release every 6-months
 - Common cycle with development milestones
 - Common cycle with intermediary releases
 - Trailing the common cycle
 - Independent release model
 - Design summit (~ Ubuntu Devels Summit)
 - Beginning devel. Cycle
 - Open to public
 - Feedback on new features & final implementation, contributors, testers

EOSC-hub OpenStack principles 2/3

OpenStack is

- Openly developed
 - Engage larger communities, boarder group of members
 - Project Team Leader (PTL), Code Reviewers
 - Specifications http://specs.openstack.org/

-by an *Open community*

- Public Meetings on IRC limited number of meeting channels
- Project IRC (Internet Relay Chat) Channels meetings logged
- Mailing Lists
- Community Support Channels
 - Bugs on <u>Launchpad</u>
 - Mailing list requests
 - IRC message requests
 - ask.openstack.org

EOSC-hub OpenStack Community

- 2010 started as joint project of Rackspace Hosting and NASA
- 2012 **OpenStack Foundation** "Protect, Empower, and Promote OpenStack software and the community around it, including users, developers and the entire ecosystem."
 - Individual membership free
 - Sponsors

EOSC-hub OpenStack laaS Platform

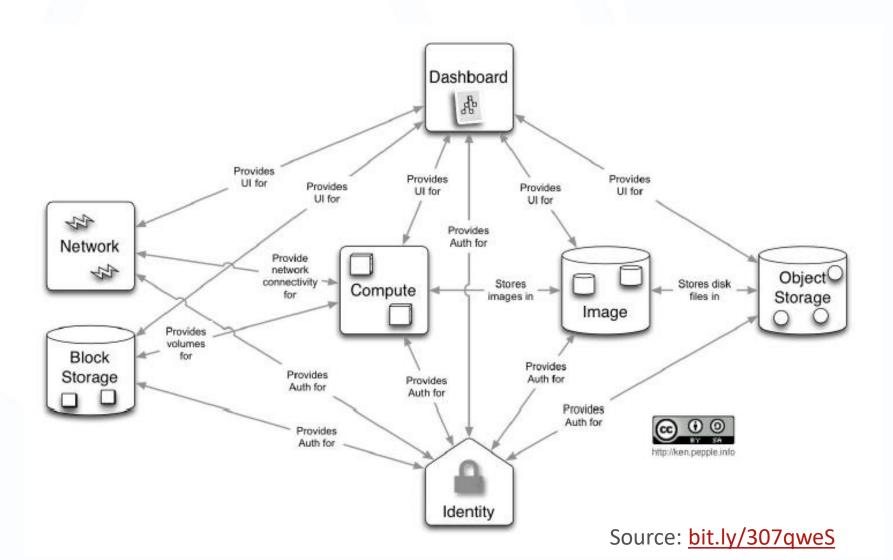

EOSC-hub OpenStack: HL overview

Source: OpenStack

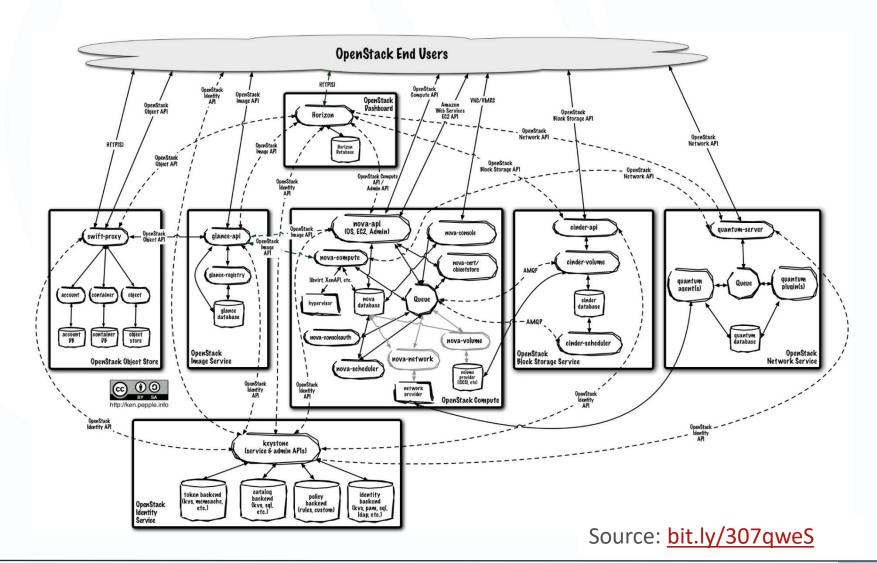

EOSC-hub OpenStack: Service Architecture

EOSC-hub Architecture – deep view

EOSC-hub OpenStack services

Service	Project Name	Description
<u>Dashboar</u> <u>d</u>	<u>Horizon</u>	Provides a web-based self-service portal to interact with underlying OpenStack services, such as launching an instance, assigning IP addresses and configuring access controls.
Compute	<u>Nova</u>	Manages the lifecycle of compute instances in an OpenStack environment. Responsibilities include spawning, scheduling and decommissioning of virtual machines on demand.
Networkin g	Neutron	Enables Network-Connectivity-as-a-Service for other OpenStack services, such as OpenStack Compute. Provides an API for users to define networks and the attachments into them. Has a pluggable architecture that supports many popular networking vendors and technologies.

Storage	Project Name	Description
Object Storage	<u>Swift</u>	Stores and retrieves arbitrary unstructured data objects via a <i>RESTful</i> , HTTP based API. It is highly fault tolerant with its data replication and scale-out architecture. Its implementation is not like a file server with mountable directories. In this case, it writes objects and files to multiple drives, ensuring the data is replicated across a server cluster.
Block Storage	<u>Cinder</u>	Provides persistent block storage to running instances. Its pluggable driver architecture facilitates the creation and management of block storage devices.

EOSC-hub OpenStack services

Shared services	Project Name	Description
Identity service	Keystone	Provides an authentication and authorization service for other OpenStack services. Provides a catalog of endpoints for all OpenStack services.
Image service	Glance	Stores and retrieves virtual machine disk images. OpenStack Compute makes use of this during instance provisioning.
<u>Telemetry</u>	<u>Ceilomete</u> <u>r</u>	Monitors and meters the OpenStack cloud for billing, benchmarking, scalability, and statistical purposes.
Higher- level services		
Orchestrati on	<u>Heat</u>	Orchestrates multiple composite cloud applications by using either the native <u>HOT</u> template format or the AWS CloudFormation template format, through both an OpenStack-native REST API and a CloudFormation-compatible Query API

And many more... For complete view see https://www.openstack.org/software/

EOSC-hub Keystone (Identity Management)

- Keystone is the identity service used by OpenStack for
 - Authentication
 - Authorization
- Supported protocols
 - Lightweight Directory Active Protocol (LDAP)
 - Federation AuthN/AuthZ via OIDC/OAuth
- Keystone primary functions
 - Service catalogue
 - User management

Domain, Project, Domain, Users, Roles

Project (Tenant)

- Base unit of "ownership" in OpenStack
- All resources in OpenStack should be owned by a specific project
- A project must be owned by a specific domain

Domain

 Collection of projects, groups and users that defines administrative boundaries for managing OpenStack Identity entities

Users

- OpenStack Identity entities represent individual API consumers and are owned by a specific domain.
- OpenStack Compute, a user can be associated with roles, projects, or both.

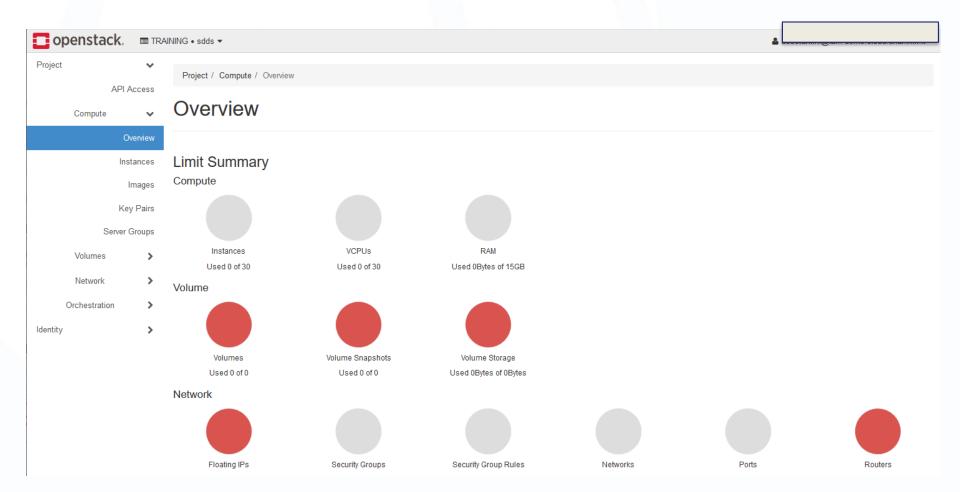

Roles

- A personality that a user assumes to perform a specific set of operations.
- A role includes a set of rights and privileges.
- A user assuming that role inherits those rights and privileges.

- Horizon provides the web interface for admin and final users
 - Written in Django (bit.ly/2YIce7E), a framework for the development of webapps in Python.
- CLI also available
- Use your own dashboard
 - OpenStack services based on APIs

EOSC-hub OpenStack survey

Promoted by OpenStack Foundation

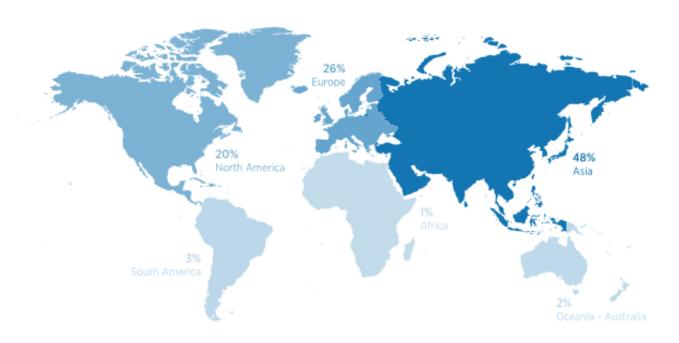

Survey Snapshot

- Data set time frame: August 2017 through August 2018
- Deployments: 858
- Unique organizations represented: 441
- Respondents with more than one deployment: 115

EOSC-hub OpenStack survey

Where in the world are OpenStack users?

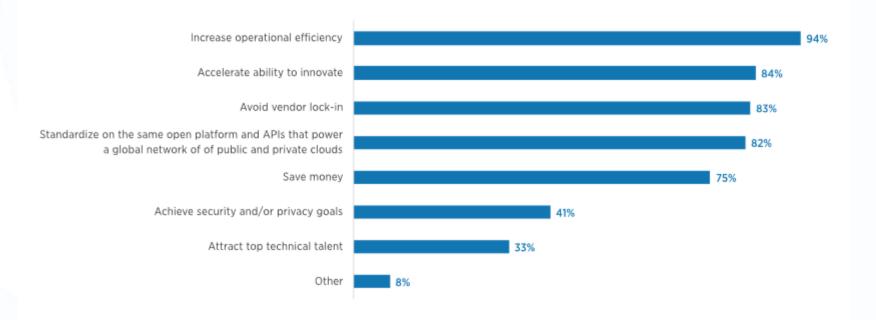

2018 shows significant increases in respondents in Asia and significant decreases in N. America, compared to both 2016 and 2017. Sample size of 687.

EOSC-hub OpenStack survey

Why do organizations choose OpenStack?

2018 results include survey responses among those who who logged at least one deployment and cannot be compared to prior years.

Hands-on exercise 1

Deploy a VM in the OpenStack cloud infrastructure

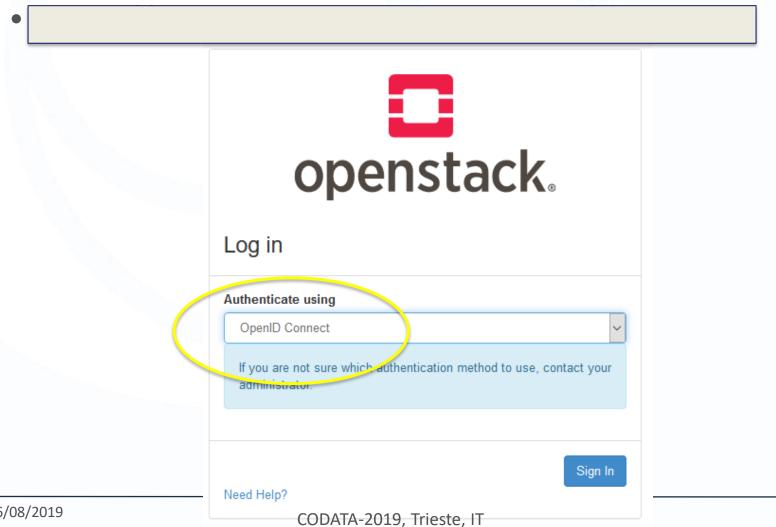

Suggestion: work in groups made by 2 or more people

The access to the resources will be valid for the duration of the course

EOSC-hub Deploy your first VM

Access the Openstack infrastructure

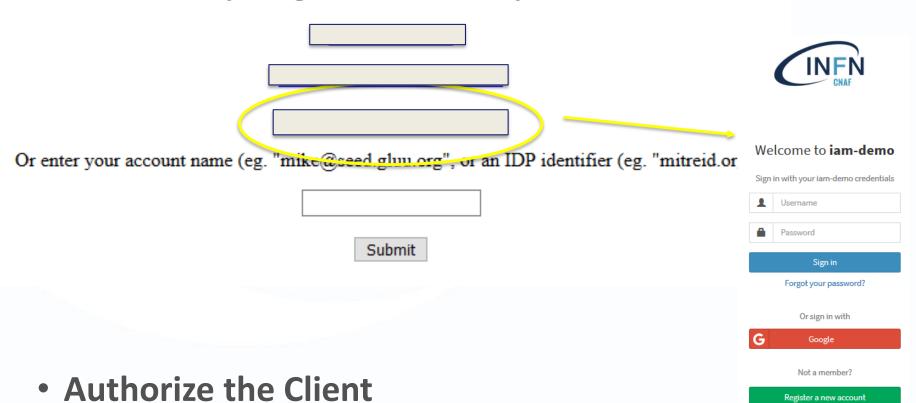

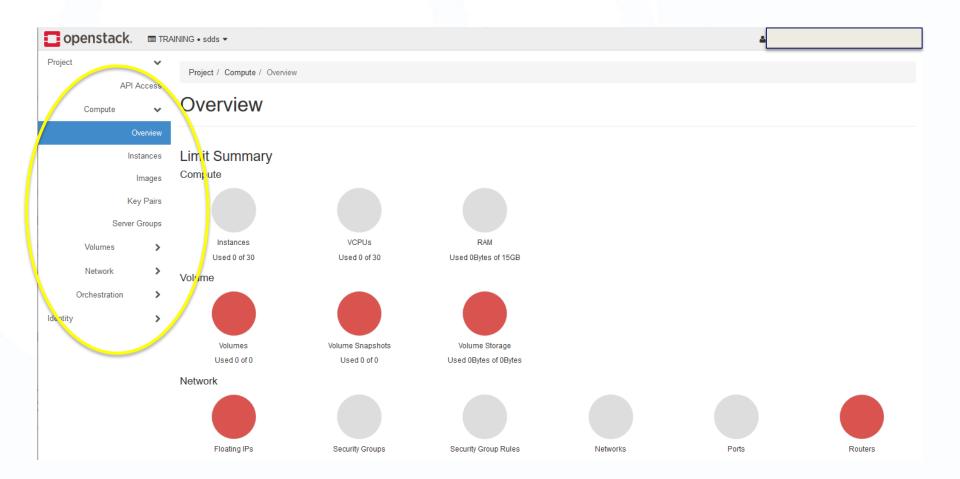

EOSC-hub Deploy your first VM

Select iam-demo IDP

Select your OpenID Connect Identity Provider

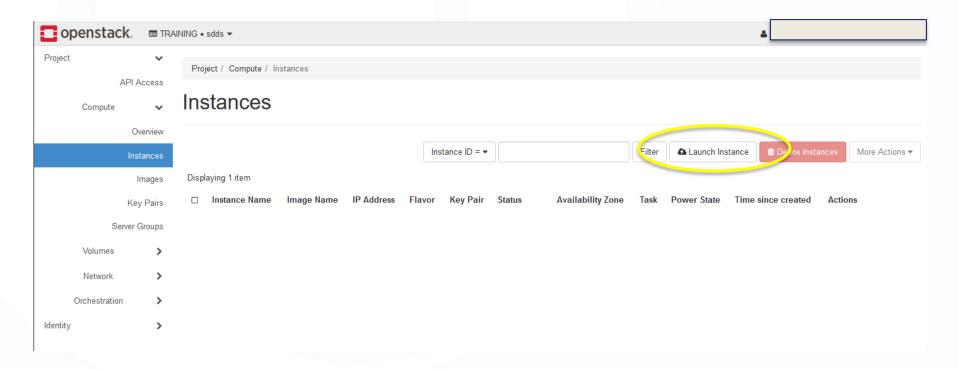

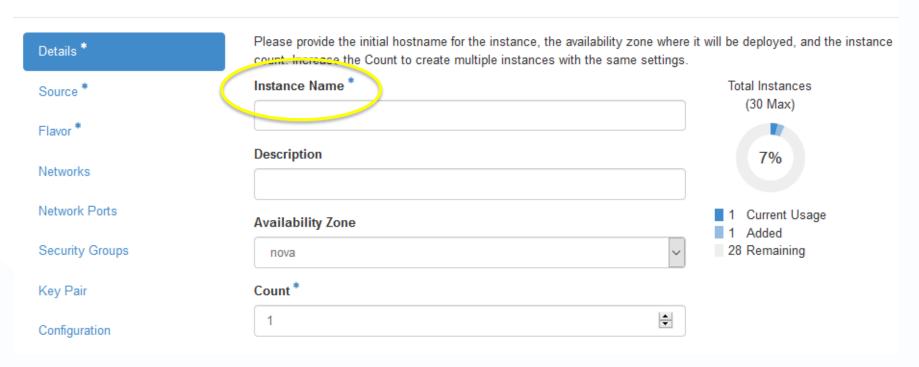

Deploy new instance

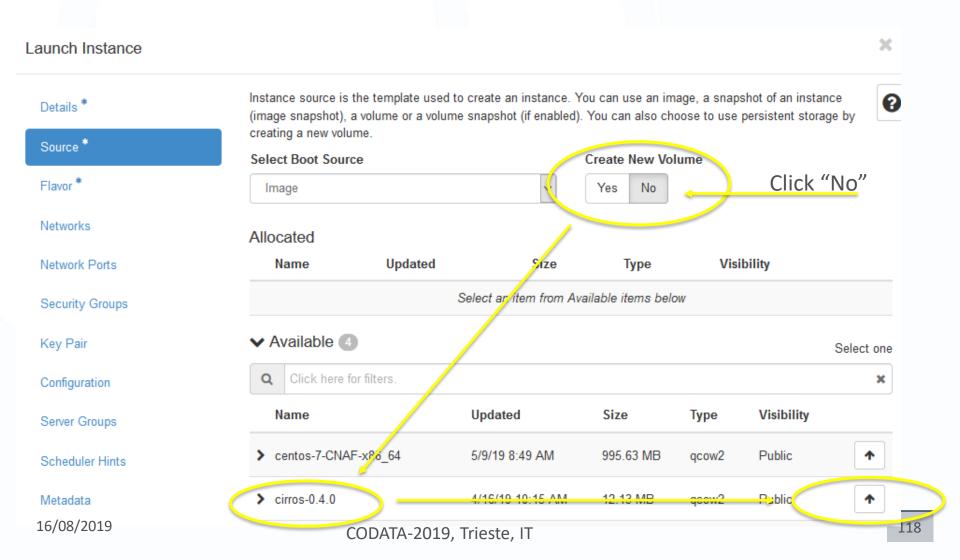

Launch Instance

Jupyter Notebooks

Jupyter as a Service in the Cloud@CNAF

Presentation Hands-on

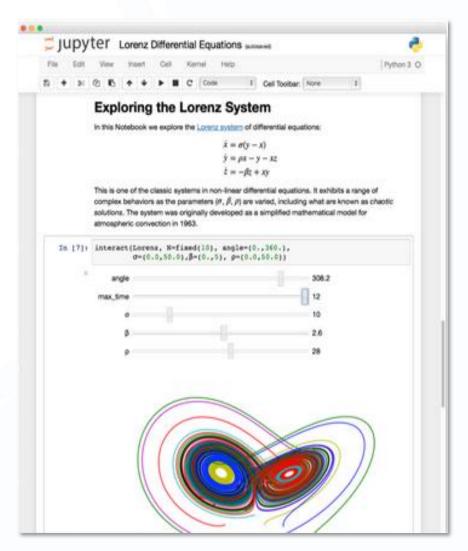

EOSC-hub The Jupyter Notebook in a nutshell

- Non-profit, open-source, interactive platform for Data Science born out of the <u>iPython</u> project in 2014
- Released under the BSD license
- Notebooks can be shared with others using email, Dropbox, GitHub
- Interactive widgets

DATA CARPENTRY

MAKING DATA SCIENCE MORE EFFICIENT

EOSC-hub Some key features

Language of choice

The Notebook has support for over **40** programming languages, including Python, R, Julia and Scala

Share notebooks

Notebooks can be shared with others using email, Dropbox, GitHub and the <u>Jupyter Notebook Viewer</u>

Interactive output

Your code can produce interactive output: HTML, images, videos, LaTeX, and custom MIME types

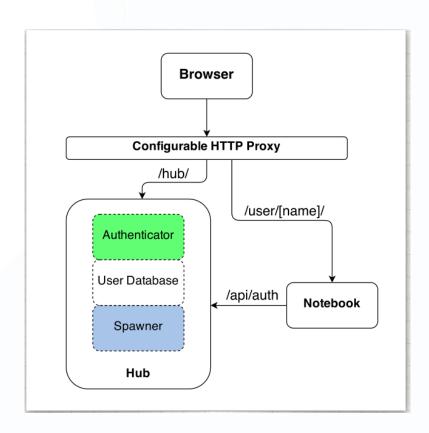

Big data integration

Leverage big data tools, such as Apache Spark for Python, R and Scala.

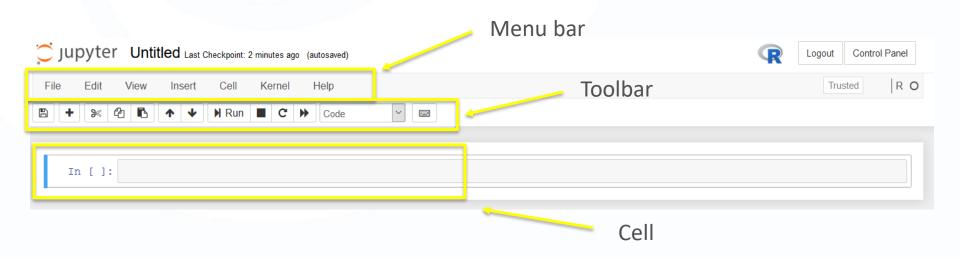

- Jupyter is single user by design
- JupyterHub is a multi-user version of notebook designed for companies, classrooms and research labs
- JupyterHub capabilities:
 - Manages Authentication
 - Spawns single-users notebooks servers on-demand
 - Gives each user a complete
 Jupyter server

EOSC-hub The Jupyter notebook control panel

- Menu bar: The menu bar presents different options that may be used to manipulate the way the notebook functions.
- **Toolbar**: The tool bar gives a quick way of performing the most-used operations within the notebook, by clicking on an icon.
- Cell: the notebook cell

EOSC-hub Structure of a notebook

- The notebook consists of a sequence of cells.
 - A cell is a multiline text input field
 - The execution behaviour of a cell is determined by the cell's type.
- There are three types of cells: Code, Markdown, and Raw cells.

Code cells allow you to edit and write new code, with full syntax highlighting and tab completion.

The programming language you use depends on the kernel

Markdown cells allow to alternate descriptive text with code

Raw cells provide a place in which you can write output directly.
Raw cells are not evaluated by the notebook

CODATA-RDA 2019

Lab session

 Download datasets (e.g. temperature) from the Climate Change Knowledge Portal and calculate and plot the average monthly temperature

The access to the resources will be valid for the duration of the course

Download dataset from the Climate Change Knowledge portal

- 1. Visit:
 - https://climateknowledgeportal.worldbank.org/download-data
- 2. Select 'Temperature', the country and the time period you are interested
- 3. Click 'Download Data', and save the CSV file on your computer as

Temperatures.csv

Climate Change Knowledge Portal For Development Practitioners and Policy Makers

COUNTRY REGION WATERSHED DOWNLOAD DATA

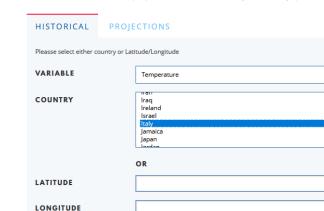

Download Data

TIME PERIOD

All historical and future climate data from the Climate Change Knowledge Portal are available for download. Select from the available options to begin query. Please make sure you agree to the Terms of Use. The available data is not intended for commercial purposes. Please contact us if you have any questions or feedback.

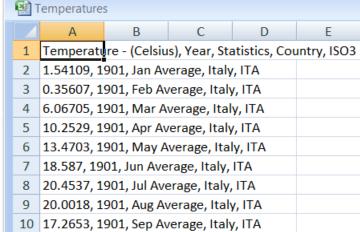

Temperature - (Celsius), Year, Statistics, Country, ISO3

1.54109, 1901, Jan Average, Italy, ITA

1901-1930

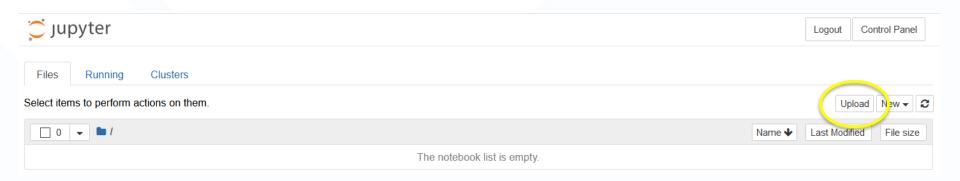

DOWNLOAD DATA

EOSC-hub Connect to Cloud@CNAF Jupyterhub

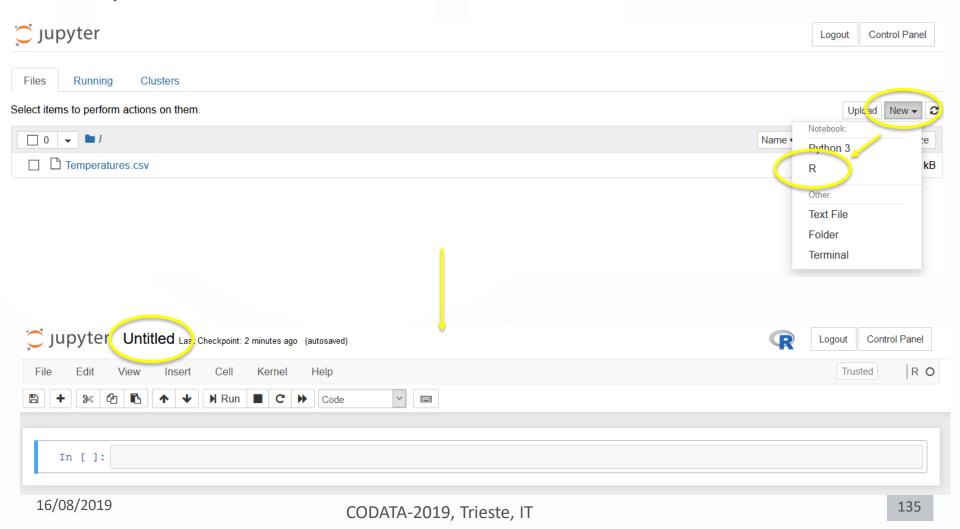

- 4. Go to the training instance of the Clod@CNAF Jupyter Notebook service:
- 5. Click on 'Sign in with iam-demo' and use your account
- 6. Wait for your Jupyter server to boot up
- 7. Upload **Temperatures.csv**

EOSC-hub Work with Notebooks

8. Open a new R Notebook and save it under a new name

EOSC-hub Works with Notebooks

9. Use the gdata() library and the read.csv() method to read the CSV file and press "Run"

```
In []: library(gdata)
  temp <- read.csv(file="Temperatures.csv", header=TRUE, sep=",")</pre>
```

Don't worry about the warnings ©

10. Use the head() method to display the first few rows of the imported dataset

(press "Run"):

head(temp) In [2]: A data frame: 6 x 5 Temperature....Celsius. Year Statistics Country ISO3 <dbl> <fct> <int> <fct> <fct> 1.54109 1901 Jan Average Italy ITA Feb Average 0.35607 1901 ITA Italy 6.06705 ITA 1901 Mar Average Italy

1901

1901

1901

Apr Average

May Average

Jun Average

Italy

Italy

Italy

ITA

ITA

ITA

10.25290

13.47030

18.58700

EOSC-hub Works with Notebooks

11. use the aggregate() function to group temperatures per Year, and to calculate the mean for each year (press "Run"):

```
In [ ]: datasets = aggregate(temp[, 1:2], list(temp$Year), mean)
```

12. Print the average mean temperature per year (press "Run"):

```
In [ ]: print(datasets)
In [4]:
        print(datasets)
           Group.1 Temperature....Celsius. Year
               1901
                                    11.01464 1901
               1902
                                    11.29684 1902
               1903
                                    11.33422 1903
               1904
                                    11.82562 1904
               1905
                                    11.15955 1905
               1906
                                    11.18498 1906
               1907
                                    11.20992 1907
               1908
                                    11.01100 1908
               1909
                                    10.88168 1909
        10
               1910
                                    11.25716 1910
```

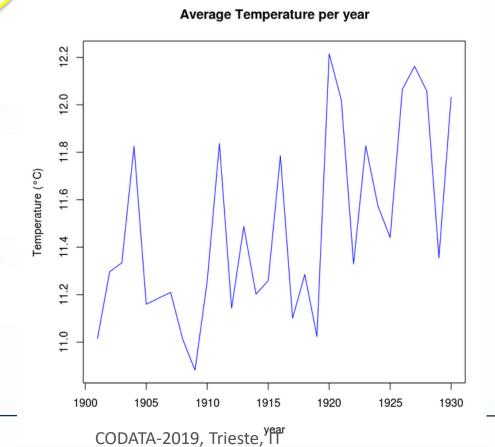

EOSC-hub Works with Notebooks

13. Drop the duplicate column (Year) and plot results (press "Run"):

In []: plot (datasets[-3], type="1", col="blue", main="Average Temperature per year", xlab="year", ylab="Temperature (°C)")

It is a lower case "L"

Cloud@CNAF Jupyter Notebook

CODATA-RDA 2019

Lab session

 Add the second datasets (e.g. rainfall) and calculate and plot the average monthly rainfall

The access to the resources will be valid for the duration of the course

The future of research compute infrastructructures in Europe

The European Open Science Cloud (EOSC)

EOSC - Problem statement

European Cloud Initiative by the European Commission (April 2016)

- 1. How to maximise the incentives for sharing data and to increase the capacity to exploit them?
- 2. How to ensure that data can be used as widely as possible, across scientific disciplines and between the public and the private sector?
- 3. How better to **interconnect** the existing and the new **data infrastructures** across Europe?
- 4. How best to **coordinate the support available** to European data infrastructures as they move towards exascale computing?

"...a trusted, open environment for the scientific community for storing, sharing and re- using scientific data and results..."

"...by 2020..."

EOSC-hub What happened since then...

© EC activities:

- EOSC summits (2017, 2018)
- 2nd EOSC HLEG (draft report bit.ly/2OSJk0b)
- EOSC implementation Roadmap (April 2018) (bit.ly/2KH56i6)
 -6 action lines (Archi., Data, Services, Access & Interf., Rules, Governance)
- Consultation with member states

H2020 projects:

- eInfraCentral (2017-19)
- EOSCpilot (2017-19) https://www.eoscpilot.eu
- EOSC-hub (2018-2020) https://www.eosc-hub.eu
- eXtremeDataCloud (2018-2020) www.extreme-datacloud.eu
- DEEP Hybrid-DataCloud (2018-2020) https://deep-hybrid-datacloud.eu

-

EOSCpilot: High Level Aims

The *EOSCpilot* project supports the first phase in the development of the EOSC. It will between 2017-2019

Establish the governance framework for the EOSC and contribute to the development of European open science policy and best practice;

Scientific demonstrators

Develop a number of demonstrators functioning as high-profile pilots that integrate services and infrastructures to show interoperability and its benefits in a number of scientific domains;

5x3 demonstrators

1FTE for 1 year / demonstrator

One 'shepherd' / demonstrator

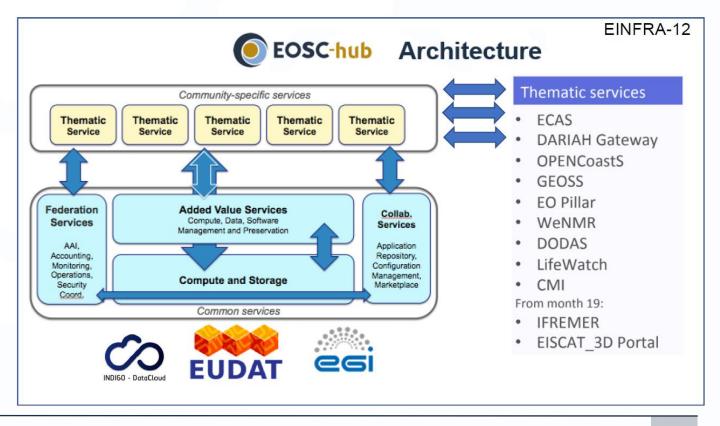

One 'shepherd' / demonstrator Engage with a broad range of stakeholders, crossing borders and communities, to build the trust and skills required for adoption of an open approach to scientific research.

EOSC Ecosystem...the oversimplified story: EOSC-hub project

EOSC-hub mobilizes providers from European major digital infrastructures, EGI, EUDAT CDI and INDIGO-DataCloud jointly offering services, software and data for advanced data-driven research and innovation

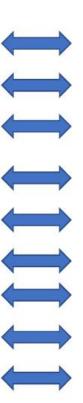

- 100 Partners
- 76 beneficiaries
- €33M total budget
- 36 months
- Jan 2018 Dec 2020

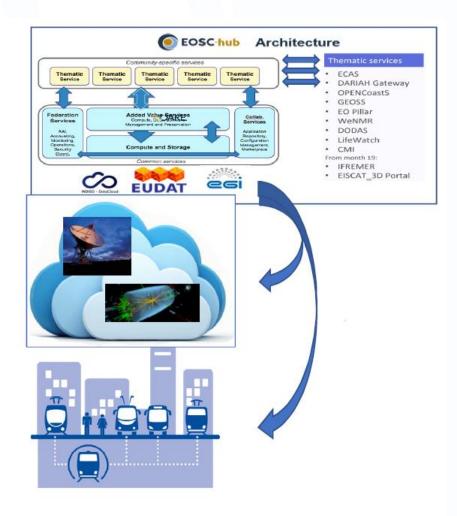

EOSC Ecosystem...the oversimplified story

- OPIE

Thematic services

- ECAS
- DARIAH Gateway
- OPENCoastS
- GEOSS
- EO Pillar
- MONMR
- DODAS
- LifeWatch
- CMI

From month 19:

- IFREMER
- EISCAT_3D Portal

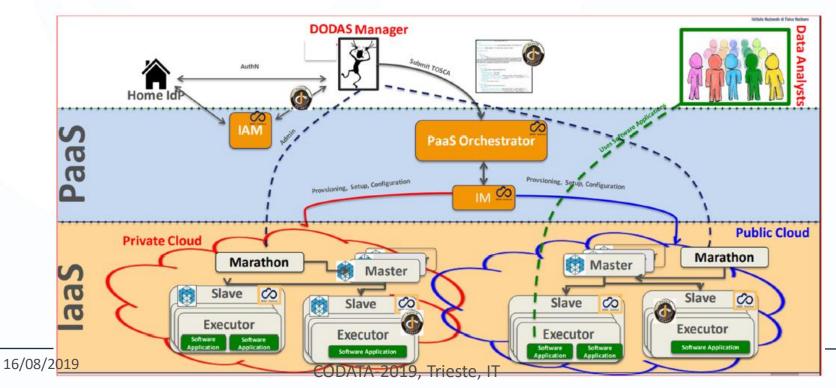

+ new service from outside the consortium

EOSC-hub DODAS in a nutshell

DODAS: Dynamic On-Demand Analysis Service

- A open source deployment manager
- Allows on-demand creation and configuration of container based clusters for data processing with almost zero effort (HTCONDOR deployment)
- Support for hybrid clouds deployment
- Based on "industry standards" to minimize code development and maintenance

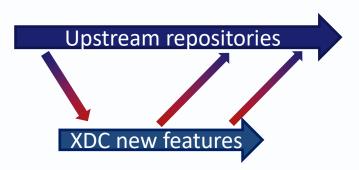

EOSC-hub eXtreme DataCloud

- The eXtreme DataCloud is a **software development** and integration project
- Develops scalable technologies for federating storage resources and managing data in highly distributed computing environments
 - Focus on efficient, policy driven and Quality of Service based DM
- The targeted platforms are the current and next generation e-Infrastructures deployed in Europe
 - European Open Science Cloud (EOSC)
 - The e-infrastructures used by the represented communities
- Improve already existing, production quality Data Management Services with new functionalities
 - Intelligent & Automated Dataset Distribution
 - Data pre-processing during ingestion
 - Metadata management
 - Data management based on storage events
 - Smart caching
 - Sensitive data handling

EOSC-hub XDC: A User Driven Project

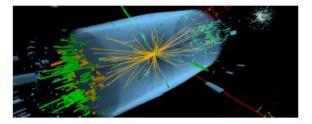

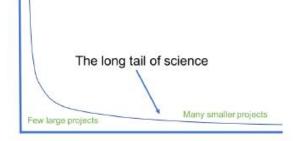

EOSC-hub DEEP HybridDataCloud

DEEP-Hybrid-DataCloud project aims to **promote the integration** of **specialized**, and **expensive**, hardware under a Hybrid Cloud platform, so it can be **used on-demand** by researchers of different communities.

- DEEPaaS to provide ML framework «as a service»
- Orchestration of long running services on containers
- Instantiation on GPU resources
- Different users' profiles served

User Driven Project

Citizen Science:

- -- Plant classification
- -- Image Classification

Earth Observation:

-- Satellite Imagery

Biological and Medical Science:

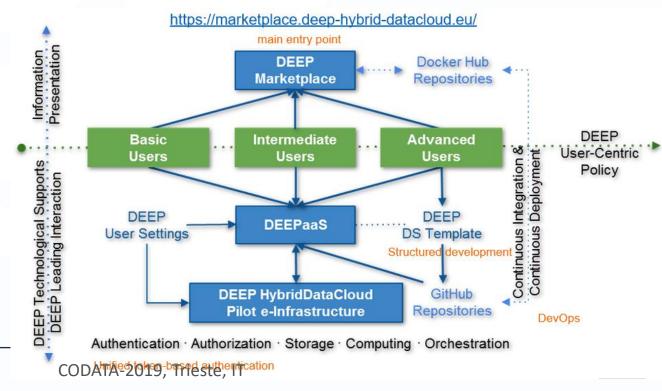

-- Retinopathy

Computing Security:

-- Massive Online Data Streams

Physics:

-- Post-processing

What's next?

- 2019:
 - DEEP-HDC All Hands Meeting
 - Poznan, Poland, 11-13 September
 - IBEGRID 2019/EOSC Synergy KOM
 - Santiago de Compostela, Spain, 23-26 September
 - Workshop on Data Management Solutions for the European Research Communities: The eXtreme-DataCloud Project
 - Helsinki, Finland 22nd October
- 2019-20:
 - Eosc-hub Week 2020
 - Karlsruhe, Germany, 10-18 May 2020
 - Focus on engaging with external communities
 - New INFRAEOSC-* projects: Research Infrastructure clusters; Commercial procurement; Governance; National services; etc.

EXTRA SLIDES

CODATA-2019, Trieste, IT

 "Open-platform for building, shipping and running distributed applications"

- Docker commoditizes containers
 - Hides and automates container management process
 - One-command-line deployment of applications
 - Easy to move from development to production
 - Provides ecosystem to create and share images

EOSC-hubContainer orchestration

kubernetes

Container Orchestrator

Schedule containers to physical or virtual machines
Restart containers if they stop
Provide private container network
Scale up and down

Infrastructure

EOSC-hubKubernetes

• Kubernetes is an open-source platform for automating deployment, scaling, and operations of application containers across clusters of hosts, providing containercentric infrastructure.

Some concepts:

- Pod: group of one or more containers, shared storage and options to run the containers
- Deployment maintains the desired count of Pods all the time
- Service: logical set of Pods and a policy by which to access them.
 - Exposed to the exterior of the Kubernetes cluster via mapping of ports and or Load Balancing
- Job: A job creates one or more pods and ensures that a specified number of them successfully terminate.
